                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            C;Comment: This protein is synthesized in the cytosol and transported into the mic;Complex: homodimer
C;Complex: homodimer
C;Complex: homodimer
C;Complex: homodimer
C;Function:
A;Description: catalyzes the exchange between cytosolic ADP and mitochondrial ATF
A;Note: located in the inner mitochondrial membrane
C;Superfamily: ADP,ATP carrier protein; ADP,ATP carrier protein repeat homodimer; methylated amino acid;
F;Seywords: acetylated amino end; duplication; homodimer; methylated amino acid;
F;59/Domain: ADP,ATP carrier protein repeat homology <ACP1>
F;10-202/Domain: ADP,ATP carrier protein repeat homology <ACP2>
F;207-298/Domain: ADP,ATP carrier protein repeat homology <ACP3>
F;207-298/Domain: ADP,ATP carrier protein repeat homology <ACP3>
F;207-Modified site: acetylated amino end (Ser) (in mature form) #status experiment
F;52/Modified site: N6-methyllysine (Lys) #status predicted
ADP,ATP carrier protein T2 - human

ADP,ATP carrier protein T3 - human
N,Alternate names: ADP,ATP carrier protein T2
C,Species: Homo sapiens (man)
C,Date: 17-Mar-2000 "-
A; Molecule type: mRNA
A; Residues: 36-104,'R',106,'A',109-298 <HOU>
A; Cross-references: GB: J03592; NID: 9339722; 1
A; Experimental source: liver

DISBASE: Defects in SLC25A4 are a cause of autsochal dominant progressive external ophthalmoplegia with various mitochondrial DNA deletions (PEO). Patients with PEO have mitochondrial myopathy, progressive external ophthalmoplegia, and other abnormalities associated with multiple different deletions of mitochondrial DNA.

SIMILARITY: Belongs to the mitochondrial carrier family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBUNIT: Homodimer.
